That's nice and all, but might you happen to have some more information?

Most importantly, we need an actual error description, i.e. what did you do, what did you expect to see, what exactly went wrong, what were the error messages. Often, you can find a stack trace in your @log/production.log@ file. That one helps tremendously.

We also need information about your ChiliProject version, your Ruby version, database, and your operating system

Ah, Sorry. I had thought this was the sandbox version of the application. This was just a test ticket. Please delete / close this request when possible. Sorry for the confusion.

We have a "demo installation":<http://demo.chiliproject.org> you can use for testing.
